SURVEY METHODOLOGY

Lake Research Partners designed and administered this survey that was conducted by telephone using professional interviewers between April 5 - 15, 2012. The survey reached a total of 713 registered Asian American voters nationwide, as well as oversamples in Florida, Illinois, Nevada, and Virginia to reach at least 100 voters in each state.

Telephone numbers for the survey were drawn randomly from a voter file. The sample was stratified geographically by region based on the proportion of voters in each region. The data were weighted by gender, age, region, and race/ethnicity.

In interpreting survey results, all sample surveys are subject to possible sampling error; that is, the results of a survey may differ from those which would be obtained if the entire population were interviewed. The size of the sampling error depends upon both the total number of respondents in the survey and the percentage distribution of responses to a particular question. For example, if 50% of respondents answered “Yes” to a particular question, we can be 95% confident that the true percentage will fall within 3.7% of this percentage, or from 46.3% to 53.7%. The table below represents the estimated sampling error for different percentage distributions of responses. Of course, the sampling error for sub-groups is greater.

**Margin of Error
for Different Percentage Distributions and Different Sample Sizes
(95% confidence)**
